

Summary

Proposed is a prefilled syringe for medical purposes, with a syringe barrel (3) with disposed there-in a syringe plunger (9) displaceable by means of a plunger rod (11), with an end plug (15) closing off the cannula side of the syringe barrel (3), said plug being provided with a through-channel (17) closed off by a membrane (19), with a finger support (13) disposed at the end of the syringe barrel (3) opposite the end plug (15) and provided with a through-opening (49) for the plunger rod (11), and with a thread system (25) that cooperates with the plunger rod (11) and the finger support (13). The syringe (1) is characterized in that the thread system (25) comprises a thread sleeve (27) detachably connected with the finger support (13), said thread sleeve being provided with an inner thread (59) that cooperates with an outer thread (29) on the plunger rod (11).
